Monthly Valuation Analysis

July 2020

# INTRODUCTION

- Analysis includes current valuation levels versus historical norms within and among various asset classes
- Results rely on historical data (i.e. current price levels are compared to historical observations)
- Historical time period used to calculate average observation is the past 15 years ending the most recent quarter-end
- Most exhibits include a ‘median’ line along with breakpoints calculated assuming a normal distribution of outcomes:
  - Conditions are expressed as probabilities with the low end (1%) implying an “expensive” situation and the high end (99%) as “inexpensive” versus history
  - +/- 0.67 standard deviations represents the 75/25% outcomes
  - +/- 1.28 standard deviations represents the 90/10% outcomes
- Yields, including dividend yield for equities, have been used throughout to create a consistent comparison when comparing one asset class to another

# CASH AND TREASURY BONDS

- Real yield on cash is again below zero
  - 3-month Treasury = 0.09%; Breakeven inflation = 1.55%
  - Yield on 10-year TIPS is negative (-1.03%); first time below -1% since their inception
  
- Spread between the broad Treasury market index and cash is again positive (0.32%)
  
- Although yields have fallen dramatically in 2020, the curve is at least upward sloping across most maturities

TREASURY INDEX VS CASH

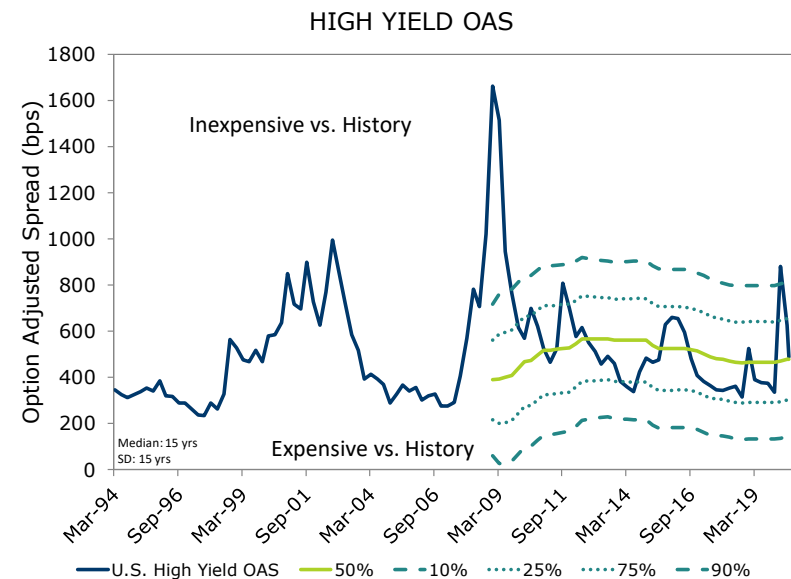

Data source: Bloomberg

# RELATIVE FIXED INCOME YIELDS

- Spread versus Treasuries on the investment grade index spiked during the first quarter but has since tightened; currently at the 46%-percentile outcome versus its 15-year history

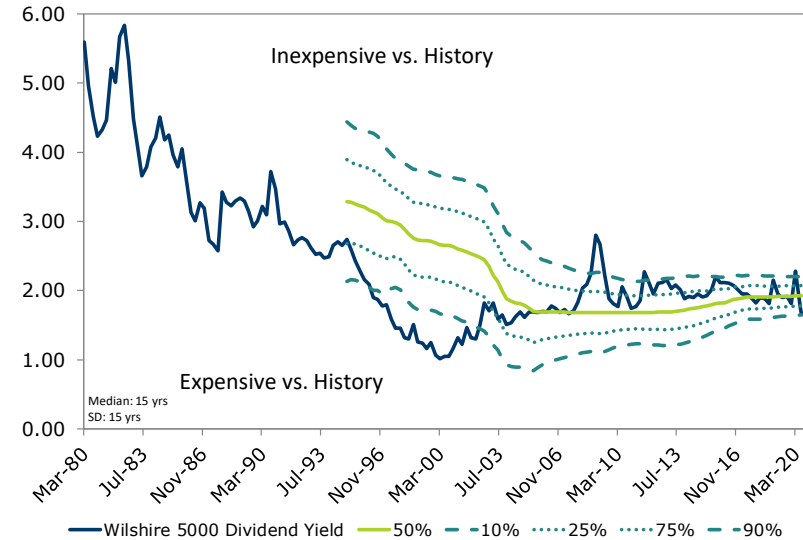

- Spread on high yield bonds has exhibited a similar pattern and is currently at the 52%-percentile outcome

# U.S. EQUITY VALUATIONS

- Distribution of historical dividend yield is tight; current observation at the 11%-percentile outcome
- Spread (discount) between the dividend yield and Treasuries has decreased as yields have fallen through the years

# CROSS-ASSET CLASS VALUATION

- Methodology: matrix below summarizes relative relationships among asset classes
  - 15 years of yield data is used for each AC
  - The difference in yield is calculated and the resulting percentile of each outcome is included in the matrix, for example:
    - » Current Treasuries to Core Bonds spread is -0.6%, above its median of -0.9%
    - » Spread is tighter than normal (with 69% probability) meaning that Treasuries are getting “inexpensive” relative to Core Bonds (which are getting “expensive”)
- Relative yields on Emerging Markets are attractive versus developed market equities
